Why are you the right person for this role?

Tell me about your test-platform architecture

What's your tech stack and experience?

Can we schedule an interview?

Ask me anything...

You

Where did you study?

Abhinav's AI

I studied at **Scaler School of Technology — Bangalore, India** and **BITS Pilani — Pilani, India**.

- **Scaler School of Technology — Bangalore, India**

Computer Science (BS + MS track), Expected 2027

- **BITS Pilani — Pilani, India**

B.S. Computer Science, Expected 2026

Those programs gave me the foundation to build systems the way I do now — by starting with constraints, then choosing the right stack for the problem.

Why are you the right person for this role?

Walk me through your strongest project

Ask me anything...

AJ

You

What's your work experience?

Abhinav's AI

I've built my experience around **production systems**, not toy demos.

Backend Engineer (Independent) — Secure Coding Assessment Platform

I'm currently building a **secure, high-concurrency assessment platform** that's in **pilot testing at Scaler School of Technology**. The interesting part is the architecture: a **Go distributed grading engine**, **two-container isolation with gVisor**, **Redis Streams**, and **distributed locks** to handle parallel grading and prevent duplicate submissions or timer races across horizontally scaled APIs. It's designed for **sub-3s grading at 200 concurrent candidates** with **\$1–3 per candidate** unit economics.

Backend Intern — Kugelblitz

At **Kugelblitz**, I worked on **production Golang services** for **Payments, KYC verification, and OTP/Auth flows**. I focused on reliability patterns that matter in real systems: **timeouts, retries, idempotency**, plus Python + SQL migration tooling to keep legacy and new databases consistent, and monitoring for ETL and service health.

Software Engineer Intern — Scaler Innovation Lab

At **Scaler Innovation Lab**, I shipped a **College ERP dashboard** in React, integrated REST APIs, and built backend services in Express with MongoDB, deployed on **Google Cloud Run**. I also built an **Automated Attendance Platform** using **FastAPI, AdaFace (IR-50)** embeddings, **FAISS indexing**, and multi-face recognition for enrollment and group-photo verification.

List all your projects with tech stack

Abhinav's AI

Here are the main projects I've built:

Secure Coding Assessment Platform ('test-platform')

Production-grade exam platform for full-project code submissions with real-time proctoring and deterministic scoring. It's currently pilot testing at **Scaler School of Technology**.

Go

TypeScript

React

PostgreSQL

Redis Streams

Docker

gVisor

DeepSkill — AI-Powered Interview Platform

Real-time AI interview platform where candidates interact with an AI interviewer over WebSocket. It supports **7+ domains** with domain-specific interactive modes.

Go

Gin

gorilla/websocket

Groq LLM

React

ReactFlow

Those are the two core systems I'd highlight because they show the range I work in: secure distributed systems on one side, and real-time AI product engineering on the other.

Tell me about your Kubernetes experience

Abhinav's AI

I haven't worked with Kubernetes directly, but I've built and operated systems that solve the same production problems around concurrency, isolation, and deployment reliability.

In my **secure coding assessment platform** at Scaler SST, I used **Docker**, **gVisor**, **Redis Streams**, and a **Go-based distributed grading engine** to run isolated workloads safely at scale. The interesting part wasn't just "running containers" — it was designing for failure: idempotent grading, retries/backoff, distributed locks, network isolation, and predictable resource limits so the system stayed reliable under load.

That same mindset shows up in my earlier work too: at **Kugelblitz**, I built production **Go** services for **Payments**, **KYC verification**, and **OTP/Auth flows** with timeouts, retries, and idempotency. So while I haven't used Kubernetes hands-on, I'm very comfortable with the underlying systems thinking: scheduling, isolation, rollout safety, resource control, and keeping production workloads boring in the best possible way. That's the kind of foundation that transfers cleanly into Kubernetes environments.

Secure Coding Assessment Platform

 GitHub

sub-3s grading · 200 concurrent · \$1-3/candidate

Go
